

#### **Agenda**

- The style tag and CSS (Cascading style sheet)
- CSS Selectors
- style tag
- class attribute
- position:
  - static
  - fixed
  - absolute
  - relative.

#### HTML is not a programing language

#### Before we continue

Like a java program, A web site is code in the form of text...

- But, unlike a java program, This text is usually located on a remote computer and instead of a compiler, the program that is in charge of interpreting it is the browser
- browser
   HTML is more like data representation than a programming language

The style attribute is a very important attribute in HTML

- There are many different style properties. In this lecture, we will go through some basic concepts in website styling
- For more style attributes, see <u>here</u>.

#### **New Job**

Congratulations! you got your first job at a company called "Playtrix"

#### <u>Job title:</u>

Mockups implementer

#### Job description:

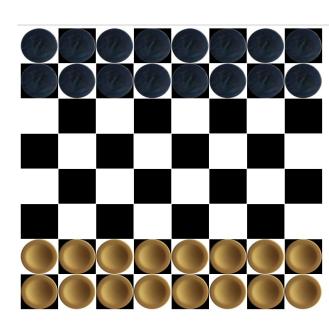

The designer will send you an image of a required page (created with Photoshop) and you will convert it into HTML with an advanced set of tools (your head and two hands)

#### **New Job**

 Playtrix is a gaming company focused on casual games

- Your first job will be to implement the basic HTML page for one of their free to play games:
- Our weird version of Checkers

#### **Checkers**

- Going back to our checkers board from the guided exercise, You remember that it was a tedious job of copy and paste
- But, you are not afraid of hard work... so:

```
<img style="width:100px;height:100px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
 <img style="width:100px;height:100px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
 <img style="width:100px;height:100px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
 <img style="width:100px;height:100px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
   style="background-color:white;width:100px;height:100px;"><i
                               style="width:100px;height:100px;" src="http://www.gammonmania.com/images/sedefli_mavi.png"></t
 <in</pre>
                              ng style="width:100px;height:100px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
 <img style="width:100px;height:100px;" src="http://www.gammonmania.com/images/sedefli mavi.png">
 <img style="width:100px;height:100px;" src="http://www.gammonmania.com/images/sedefli mavi.png">
 <img style="width:100px;height:1
 <img style="width:100px;height:1</pre>
 <img style="width:100px;height:1</pre>
 <img style="width:100px;height:1">
 <img style="width:100px;height:1</pre>
 <img style="width:100px;height:1</pre>
 <img style="width:100px;height:1</p>
 <img style="width:100px;height:1</pre>
                                                                      ng">
(b toggl.com
```

- After a long two hours of work (Typing code, copy & paste and validating the results of course...)
- The Designer comes to your desk...

We just had a meeting about Checkers... we decided to make the squares smaller, so please change it to 80px by 80px

Can anyone name him please?

#### So what do you do?

```
<img style="width:80px;height:80px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
 style="background-color:black;width:80px;height:80px;"><img style="width:80px;height:80px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
 style="background-color:white;width:80px;height:80px;"><img style="width:80px;height:80px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
<img style="width:80px;height:80px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
<img style="width:80px;height:80px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
<img style="width:80px;height:80px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
<img style="width:80px;height:80px;" src="http://www.gammonmania.com/images/sedefli mavi.png">
<img style="width:80px;height:80px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
<img style="width:80px;height:80px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
<i</pre>
                                 style="width:80px;height:80px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
<im</pre>
                                 style="width:80px;height:80px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
<img</pre>
                                 style="width:80px;height:80px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
<im</pre>
                                  style="width:80px;height:80px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
<i
</pre>
                                 style="width:80px;height:80px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
<ir</pre>
                                 style="width:80px;height:80px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
<img style="width:80px;height:80px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
style="background-color:white;width:80px;height:80px;">
```

Search & replace...

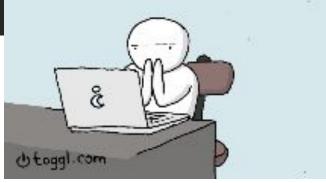

Hey new guy, 80px is too small.. Make it 90px, Oh and please add 6px, black border to the board itself

```
ble style="border-width:6px;border-color:black;border-style: solid;">
  <img style="width:90px;height:90px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
  <img style="width:90px;height:90px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
  <img</pre>
                                            style="width:90px;height:90px;" src="http://www.gammonmania.com/images/sedefli mavi.png">
  <img</pre>
                                            style="width:90px;height:90px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
  <imp</pre>
                                            style="width:90px;height:90px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
  <im</pre>
                                            style="width:90px;height:90px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
                                            style="width:90px;height:90px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
  <i</pre>
  <img</pre>
                                            style="width:90px;height:90px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
  <img style="width:90px;height:90px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
                                            style="width:90px;height:90px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
  <im</pre>
                                             style="width:90px;height:90px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
  <im</pre>
  <img</pre>
                                            style="width:90px;height:90px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
  <img</pre>
                                            style="width:90px;height:90px;" src="http://www.gammonmania.com/images/sedefli mavi.png">
  <img</pre>
                                            style="width:90px;height:90px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
   <img</pre>
                                            style="width:90px;height:90px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
   <img style="width:90px;height:90px;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
  <td style="background-col
  <td style="background-col
  <td style="background-cole
  <td style="background-col
  <td style="background-col
  <td style="background-cole
  <td style="background-colo
```

Hmmm...

The CMO just finished her research and it turns out that if we replace the white squares with red, the players stay longer. And also the front end dev requested a different mouse cursor for the pieces

#### <itc>

#### **Styling**

```
<img style="width:90px;height:90px;cursor:pointer;"</pre>
```

ch toggl.com

```
style="border-width:6px;border-color:black;border-style: solid;">
          <img style="width:90px;height:90px;cursor:pointer;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
          <img style="width:90px;height:90px;cursor:pointer;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
         <img style="width:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90p
          <img style="width:90px;height:90px;cursor:pointer;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
          <img style="width:90px;height:90px;cursor:pointer;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
          <img style="width:90px;height:90px;cursor:pointer;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
                style="background-color:black;width:90px;height:90px;"><img style="width:90px;height:90px;cursor:pointer;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
          <img style="width:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;height:90px;heigh
          <img style="width:90px;height:90px;cursor:pointer;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
                                                                                                                                 idth:qanv:haicht:qapx;cursor:pointer;" src="http://www.gammonmania.com/images/sedefli_mavi.png">
          Urrgghhh!
```

You probably think to yourself "Surely there must be an easier way..."

Meet the <style> tag

The <style> tag is used to define style **information** for an HTML document.

The style tag must be located inside the <head> tag of your document

Meet the <style> tag

## <style></style>

Inside the <style> element you specify **how** HTML elements should render in a browser.

Each HTML document can contain multiple <style> tags

For example:

```
width:90px;
height:90px;
cursor:pointer;
```

Now, all of our <img> tags will receive those styling properties

```
tagname {
   propname:propvalue;
   propname2:propvalue2;
}
```

Now we can remove all of the style attributes from our <img> tags in the document

```
<img src="http://www.gammonmania.com/images/sedefli_mavi.png">

<img src="http://www.gammonmania.com/images/sedefli_mavi.png">

<img src="http://www.gammonmania.com/images/sedefli_mavi.png">
```

Much better!

And also move the common style properties from the tag to the <style> tag

```
<style>
    img{
        width:90px;
        height:90px;
        cursor:pointer;
    }
    td{
        width:90px;
        height:90px;
        height:90px;
    }
</style>
```

The code is much cleaner now

```
<img src="http://www.gammonmania.com/images/sedefli_mavi.png">
   <img src="http://www.gammonmania.com/images/sedefli mavi.png">
   <img src="http://www.gammonmania.com/images/sedefli_mavi.png">
   <img src="http://www.gammonmania.com/images/sedefli_mavi.png">
   <img src="http://www.gammonmania.com/images/sedefli_mavi.png">
   <img src="http://www.gammonmania.com/images/sedefli_mavi.png">
   <img src="http://www.gammonmania.com/images/sedefli_mavi.png">
   <img src="http://www.gammonmania.com/images/sedefli_mavi.png">
 <img src="http://www.gammonmania.com/images/sedefli_mavi.png">
   <img src="http://www.gammonmania.com/images/sedefli_mavi.png">
   <img src="http://www.gammonmania.com/images/sedefli mavi.png">
   <img src="http://www.gammonmania.com/images/sedefli_mavi.png">
   <img src="http://www.gammonmania.com/images/sedefli_mavi.png">
   <img src="http://www.gammonmania.com/images/sedefli mavi.png">
 ctd style="background-color:black:"></ti>
```

Let's change the square size back to 100px

#### But now can you smile!

No problem!

```
<style>
    img{
         width: 100px;
         height:100px;
         cursor:pointer;
    }
td{
         width:100px;
         height: 100px;
</style>
                          &toggl.com
```

#### **Questions?**

Hey, Melissa does not like the default red color you chose. Please use this one: rgb(200,20,60) it is called Crimson

We need a way to group all of the red cells and tell the browser to set their background to the new red (I mean Crimson)

```
<img src="http://www.gammonmania.com/images/sedefli mavi.png">
   style="background-color:black;"><img src="http://www.gammonmania.com/images/sedefli_mavi.png">
   style="background-color:red;"><img src="http://www.gammonmania
   style="background-color:black;"><img src="http://www.gammonmar
   style="background-color:red;"><img src="http://www.gammonmania
   style="background-color:black;"><img src="http://www.gammonmani
<img src="http://www.gammonmania</pre>
<img src="http://www.gammonman</pre>
                                                        Otoggl.com
```

CSS can help us with that too!

Class attribute: We can use a new attribute, The class attribute is used to group HTML elements that have a common purpose or meaning.

- We add the class attribute like any other HTML attribute
- Try to give it a meaningful name
- We will use "dark" for the black and "light" for the "red". This is how it looks:

```
<img src="http://www.gammonmania.com/images/sedefli_mavi.png">
</d>
<img src="http://www.gammonmania.com/images/sedefli_mavi.png">
</d>

<img src="http://www.gammonmania.com/images/sedefli_mavi.png">

<img src="http://www.gammonmania.com/images/sedefli_mavi.png">

<img src="http://www.gammonmania.com/images/sedefli_mavi.png">

<img src="http://www.gammonmania.com/images/sedefli_mavi.png">

<img src="http://www.gammonmania.com/images/sedefli_mavi.png">

<img src="http://www.gammonmania.com/images/sedefli_mavi.png">

<img src="http://www.gammonmania.com/images/sedefli_mavi.png">
```

And then add the class definition to the <style> tag

```
.dark {
    background-color: black;
}
.light {
    background-color: rgb(200, 20, 60)
}
```

#### Our new code:

```
<style>
  img {
    width: 100px;
    height: 100px;
    cursor: pointer;
 td {
    width: 100px;
    height: 100px;
  .dark {
    background-color: black;
  .light {
     background-color: rgb(200,20,60)
</style>
```

- All <img> tags in the document should be 100x100 and have a pointer cursor
  - All tags in the document should be 100x100
  - All elements in the document that are classified as dark should be black

All elements in the document that are classified as "light" should be crimson

#### **Summary**

 CSS separates presentation(style) from content(data)

 In order to connect between the two we use the class attribute

#### **Questions?**

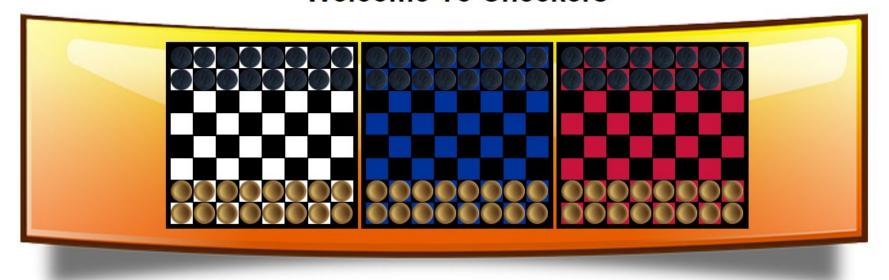

Hey, We are building the website for the checkers game. Here is the mockup...

#### <itc>

# **Styling**

#### **Welcome To Checkers**

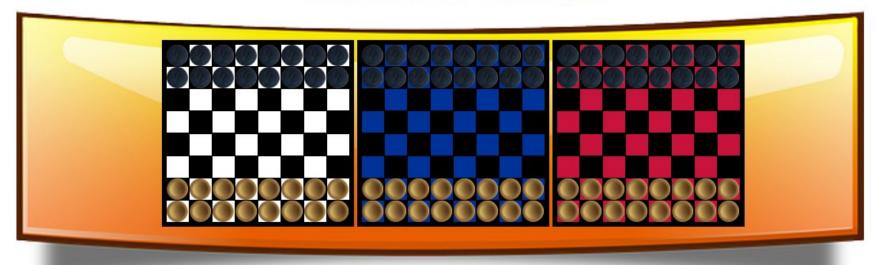

#### **Welcome To Checkers**

- How can we create the three different boards?
- boards?
   First, we need to copy and paste the board's HTML structure.

We will add a new class attribute to each

And add the following css rules to our <style> tag

```
.white-table .light{
  background-color: white;
}
.blue-table .light{
  background-color: blue;
}
.red-table .light{
  background-color: red;
}
```

All elements classified as "light" under an element classified as "white-table" Should have a white background

#### **CSS Selectors**

In CSS, selectors are patterns used to select the element(s) you want to style.

```
.white-table .light{
 background-color: white;
.blue-table .light{
 background-color: blue;
.red-table .light{
 background-color: red;
```

.white-table .light is a css selector

#### **CSS Selectors**

#id example: #itc-12345678

.class example: .white-table

[attribute=value] example: [src='www.israeltechallenge.com/icon1.png']

HTML tag example: div

#### More?

http://www.w3schools.com/cssref/css\_selectors.asp

- This is a new CSS selector (which is actually a single space)
- It describes the relation of a parent element and a child element

#### CSS Selectors – Relations

<u>element</u>	р	Selects all  elements
element,element	div, p	Selects all <div> elements and all  elements</div>
element element	div p	Selects all  elements inside <div> elements</div>
<u>element&gt;element</u>	div > p	Selects all  elements where the parent is a <div> element</div>
<u>element+element</u>	div + p	Selects all  elements that are placed immediately after <div> elements</div>
<u>element1~element2</u>	p ∼ ul	Selects every <ul> element that are preceded by a  element</ul>

The child can be any descendant of the parent tag!

```
.container h3{
   color:red;
}
```

The child can be any descendant of the parent tag!

```
.container h3{
   color:red;
}
```

The class attribute specifies one or more class names for an element.

```
.classname {
  propname:propvalue;
}
```

The class attribute specifies one or more class names for an element.
 What does it mean?
 It means that an HTML element can have 2 classnames.

```
HTML:
<img class="classname1 classname2" />

CSS:

.classname1.classname2 {
   propname:propvalue;
}
```

#### CSS Selectors – Game Time

```
<body>
 <div class="menu">
   PLAYGROUND
   <span class="menu-item">about</span>
   <span class="menu-item">contact</span>
   <span class="menu-item">home
      <img src="./logo.png"/>
   </span>
    <a href="http://www.google.com">google</a>
  </div>
  <div class="pages">
   <span>
      <img src="./flower.png"/>
      <a href="http://www.w3.org">w3c</a>
    </span>
 </div>
</body>
```

## How to style this element?

Css selector	example
Tag selector	div
Class selector	.my-class
Attribute	[target="self"]
Nesting	div span

#### CSS Selectors – Game Time

```
<body>
 <div class="menu">
   PLAYGROUND
   <span class="menu-item">about</span>
   <span class="menu-item">contact</span>
   <span class="menu-item">home
     <img src="./logo.png"/>
   </span>
    <a href="http://www.google.com">google</a>
 </div>
  <div class="pages">
   <span>
      <img src="./flower.png"/>
     <a href="http://www.w3.org">w3c</a>
    </span>
 </div>
</body>
```

## How to style this element?

Css selector	example
Tag selector	div
Class selector	.my-class
Attribute	[target="self"]
Nesting	div span

#### CSS Selectors – Game Time

```
<body>
 <div class="menu">
   PLAYGROUND
    <span class="menu-item1">about</span>
    <span class="menu-item2">contact</span>
   <span class="menu-item3">home
      <img src="./logo.png"/>
    </span>
    <a href="http://www.google.com">google</a>
  </div>
  <div class="pages">
   <span>
     <img src="./flower.png"/>
     <a href="http://www.w3.org">w3c</a>
    </span>
 </div>
</body>
```

# How to style this element?

Css selector	example
Tag selector	div
Class selector	.my-class
Attribute	[target="self"]
Nesting	div span

#### CSS Selectors – Game Time

```
<body>
 <div>
   PLAYGROUND
   <span class="menu-item bold">about</span>
   <span class="menu-item">contact</span>
   <span class="menu-item">home
      <img src="./logo.png"/>
   </span>
    <a href="http://www.google.com">google</a>
  </div>
 <div class="pages">
   <span>
      <img src="./flower.png"/>
      <a href="http://www.w3.org">w3c</a>
    </span>
 </div>
</body>
```

Tag selector	div
Class selector	.my-class
Attribute	[target="self"]
Nesting	div span

#### CSS Selectors – Game Time

```
<body>
 <div>
   PLAYGROUND
   <span class="menu-item">about</span>
   <span class="menu-item">contact</span>
   <div class="menu-item">home
      <img src="./logo.png"/>
   </div>
    <a href="http://www.google.com">google</a>
 </div>
 <div>
   <span>
      <img src="./flower.png"/>
      <a href="http://www.w3.org">w3c</a>
    </span>
 </div>
</body>
```

## How to style this element?

Css selector	example
Tag selector	div
Class selector	.my-class
Attribute	[target="self"]
Nesting	div span

#### Remember me?

#### **Welcome To Checkers**

- Let's get back to our game
- We dealt with colors, but also the rows should be smaller...

We will also reduce the cell size to 30px

```
img{
    width:30px;
    height:30px;
    cursor:pointer;
}

td{
    width:30px;
    height:30px;
}
```

## So far...

- We copied our tables
- Added colors:

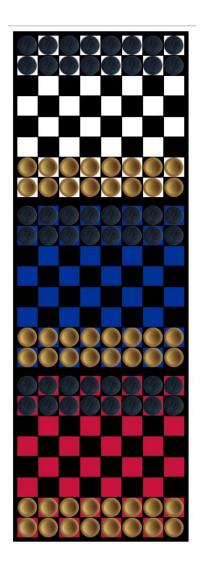

```
.white-table .light{
  background-color: white;
}
.blue-table .light{
  background-color: blue;
}
.red-table .light{
  background-color: red;
}
```

And changed the size:

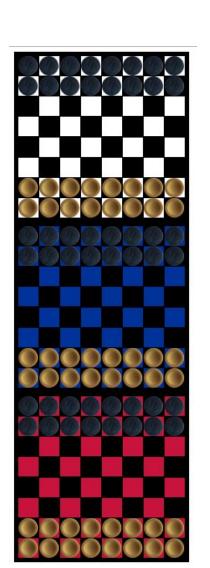

```
img{
    width:30px;
    height:30px;
    cursor:pointer;
}

td{
    width:30px;
    height:30px;
}
```

#### The result:

- The boards are sitting on top of each other But in the mockup they are aligned in a row
- The reason: The "display" property
- A very important property that defines the layout of elements in the doc
- It has 4 basic values:
  - Inline
  - Inline-block
  - Block
  - none

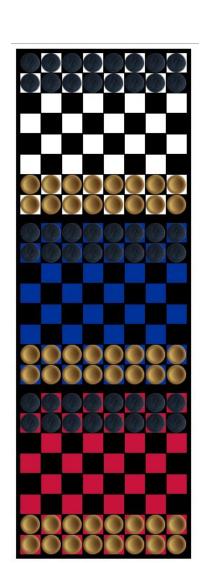

- As mentioned in the last lecture, every element has a default display value. However, you can override this with style.
- Some inline elements (do you remember?)

```
<span>
<a>>
<img>
```

Some block elements <h1> - <h6> >

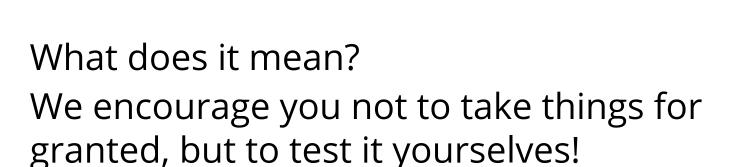

- Content model
  - Inline elements should only contain other inline elements as well as content
  - block elements can contain block elements, inline elements and content
- Appearance
  - Inline elements can't have width or height properties
  - When they have no space limitation, Block elements can take up the entire screen

Inline elements can't have width or height properties?

- Formatting
  - Inline elements do not begin on a new line (they can start everywhere)
  - Block elements begin on a new line and take all of that line

```
<h1>Hello </h1>
<h2>How are you?</h2>
<span>Hope this webpage finds you well </span>
<a href="candycrushsaga.com/"> and ready for fun!</a>
```

#### Hello

How are you?

Hope this webpage finds you well and ready for fun!

Inline elements don't "disrupt" the layout of other elements next to it

```
<h1>go to <a href="www.google.com" >google</a> website</h1>
```

Where as block elements...

```
<a href="www.google.com" > <h1>go to google</h1> </a> website
```

## **Inline-block and None**

- Display: none; means don't show the element and the content in it
- Display: inline-block; are like inline elements, but you can set their width and height.

## **Inline-block and None**

- Display: none; means don't show the element and the content in it
- Not to be confused with visibility: hidden

Link to code

```
display none:
visibility hidden:
```

```
CSS:
div {
   background: gold;
   border: solid black 1px;
   width: 200px;
.inner {
   height: 100px;
   background: salmon;
.display-none {
   display: none;
.visibility-hidden {
   visibility: hidden;
```

## Back to our example...

- A tag can and should contain other block elements. This is why it is a block-level element
- Block-level elements end with a new line (a bit like println)
- Because this is just a formatting decision we can change it using style

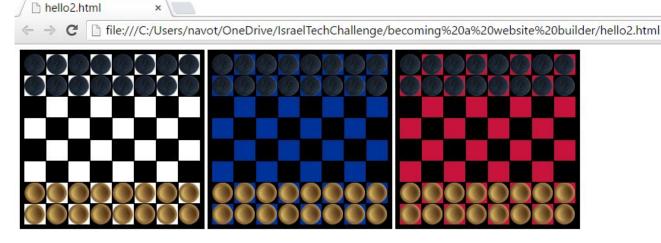

- Changing the formatting property value of an element will not change the content meaning of the block!!!
- An inline element with display: block; is not allowed to have other block elements inside it.

It will still work though... but makes no sense

sdsadad sdsadad

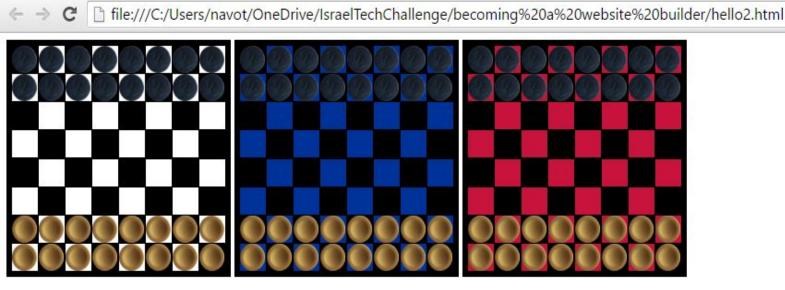

```
table{
    border-width:6px;
    border-color:black;
    border-style: solid;
    background-color:black;
    display:inline;
}
```

hello2.html

- We need to center the boards
- To do that we can use the text-align property
- The text align property sets the align of children elements in a container

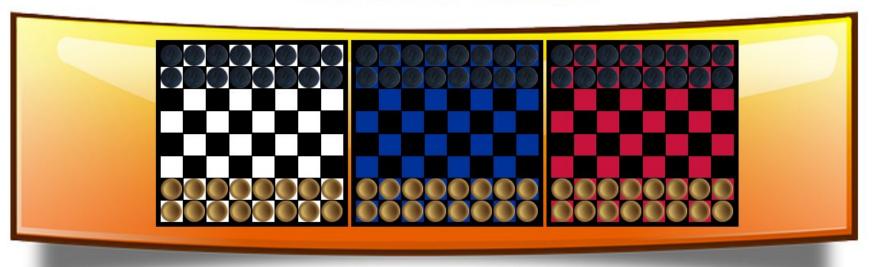

So we will wrap the boards with a <div> and name it "boards-holder"

```
<div class="boards-holder">
   <img src="http://www.gammonmania.com/images/sedef</pre>
           <img src="http://www.gammonmania.com/images/sede</pre>
           <img src="http://www.gammonmania.com/images/sede</pre>
.boards-holder{
    text-align:center;
    C ifile:///C:/Users/navot/OneDrive/IsraelTechChallenge/becoming%20a%20website%20builder/hello2.html
                                                                        Q 🗘 🔲 🗏
```

#### Adding the title is a piece of cake

#### **Welcome To Checkers**

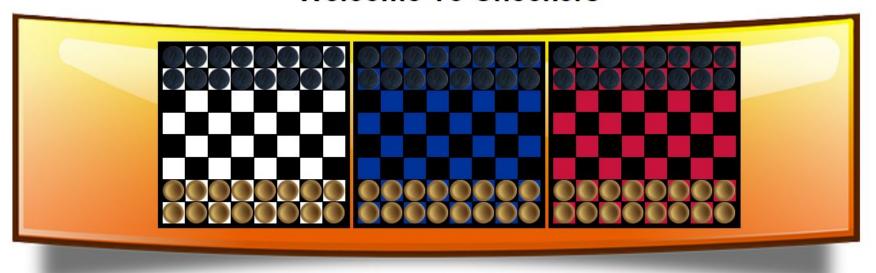

```
.game-title{
    font-size:40px;
    font-family:Arial;
    text-align:center;
}
```

- The banner in the background is an image
- We will add that as well

#### **Welcome To Checkers**

Where is the banner?! width:30px; height:30px; Remember this? cursor:pointer; hello2.html file:///C:/Users/navot/OneDrive/IsraelTechChallenge/becoming%20a%20website%20builder/hello2.html **Welcome To Checkers** 

CSS selectors have hierarchy - The more specific the selector is, the more powerful it is

In case of overlapping style properties the most powerful selector will affect the element with its properties values

```
<style>
                                                  What will be the
   img{
       width: 200px;
                                                  width of this img?
       height:200px;
       border:1px solid black;
    img.banner{
       width:500px;
       cursor:pointer;
                                       img {
                                          width: 200px;
    .image-holder img.banner{
       width: 150px;
                                          height: 200px;
                                          border: ▶1px solid ■black;
                                                Curtesy chrome dev tools
<img src="./banner.png" />
<div class="image-holder">
    <img class="banner" src="./banner.png" />
    <img src="./banner.png" />
</div>
```

```
<style>
                                                        What will be the
    img{
        width: 200px;
                                                        width of this img?
        height: 200px;
        border:1px solid black;
    img.banner{
        width:500px;
        cursor:pointer;
                                          .image-holder img.banner {
                                                                         test.html:12
                                            width: 150px;
    .image-holder img.banner{
        width: 150 px;
                                         img.banner {
                                                                         test.html:8
                                            width: 500px;
                                            cursor: pointer;
<img src="./banner.png" />
                                         img {
                                                                          test.html:3
<div class="image-holder">
    <img class="banner" src="./banner.</pre>
                                            height: 200px;
    <img src="./banner.png" />
                                            border: ▶1px solid ■black;
</div>
```

```
<style>
                                                   What will be the
   img{
       width: 200px;
                                                   width of this img?
       height: 200px;
       border:1px solid black;
    img.banner{
       width:500px;
       cursor:pointer;
    .image-holder img.banner{
                                         img {
       width: 150 px;
                                            width: 200px;
                                            height: 200px;
                                            border: ▶1px solid ■black;
<img src="./banner.png" />
<div class="image-holder">
    <img class="banner" src="/banner.png" />
    <img src="./banner.png" //>
</div>
```

```
<style>
    img{
        width: 200px;
        height: 200px;
        border:1px solid black;
    img.banner{
        width:500px;
        cursor:pointer;
    .image-holder img.banner{
        width: 150 px;
<img src="./banner.png" />
<div class="image-holder">
    <img class="banner" src="./banner.png" />
    <img src="./banner.png" />
</div>
```

All images will have the same height and a 1 pixel border

So we need something more specific ...

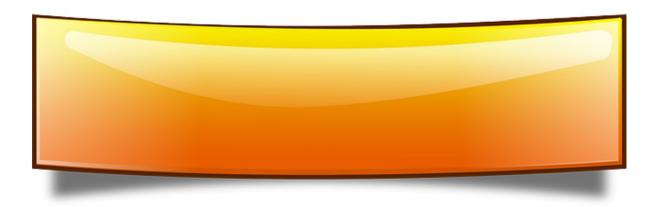

### **Questions?**

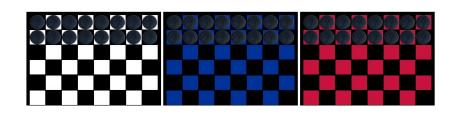

- We want to locate the image at a specific location
- In order to do that we need to use the position property

#### **Welcome To Checkers**

#### **Position - the General Case**

We want to create a box and a button.

But how will they look like?

If we have the following html:

And the following CSS:

```
<style>
    .container {
        width: 150px;
        height: 100px;
        background: lightpink;
    }
</style>
```

# The result will be: This is the default position.

#### **Position - the General Case**

What if we want the button to be on the bottom right corner?

The position style property has a few different values

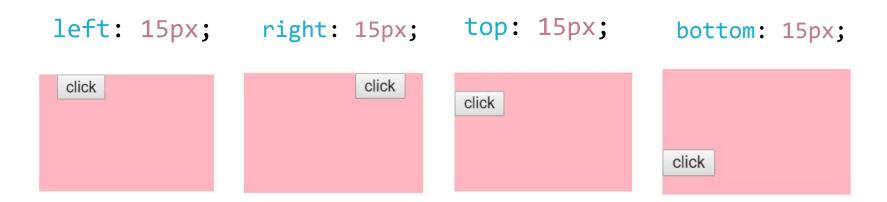

static Absolute

fixed Relative

First we choose the position.

Then, elements can be positioned using the top, bottom, left, and right properties
They will be moved away, usually by a few pixels.

But away from what?

That will be dictated by the position type!

#### **Static Position**

- HTML elements are positioned as static by default.
- Static positioned elements are not affected by the top, bottom, left, and right properties.
- An element with position: static; is not positioned in any special way; it is always positioned according to the normal flow of the page

#### **Fixed Position**

- An element with **position: fixed**; is positioned relative to the viewport (the screen) what is a viewport? Let's see!
  - it always stays in the same place even if the page is scrolled.
- The top, right, bottom, and left properties are used to position the element.
- A fixed element does not leave a gap in the page where it would normally have been located.

#### **Relative Position**

- An element with position: relative; is positioned relative to its normal position (relative to it's static position).
- Setting the top, right, bottom, and left properties of a relatively-positioned element will cause it to be adjusted away from its normal position.
  - Top:20px; will shift it 20 pixels down from the original location. While top: -20px will push it up.
- The element leaves a gap in the place it was.
- Other content will not be adjusted to fit into any gap left by the element.

#### Live code example

#### **Absolute Position**

- An element with position: absolute; is positioned relative to the nearest positioned ancestor (instead of positioned relative to the viewport, like fixed).
- However: if an absolute positioned element has no positioned ancestors, it refers to the document body.
  - These elements are not effected by other elements nor do they effect them.

Note: A "positioned" element is one whose position is anything except static.

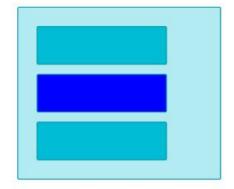

#### Live code example

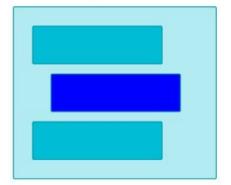

#### **Positions**

#### **Example**

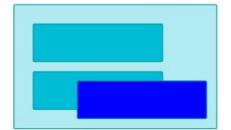

position: static

position: relative left: 20px

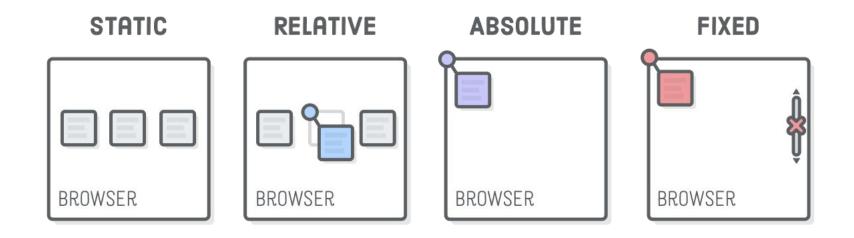

position: absolute bottom: 0; right: 0

#### **Positions**

#### **Example**

#### **Positioning**

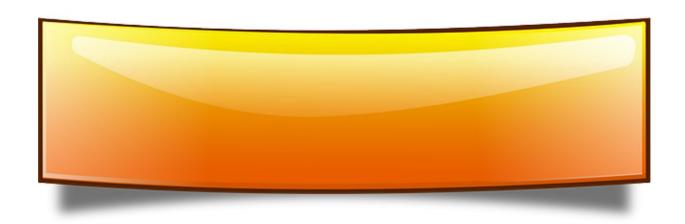

# This is a very complex topic, which is very hard to grasp at first.

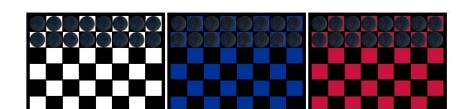

Google is your best friend!

#### So that is where we were

Now we want to locate the image at a specific location

**Welcome To Checkers** 

- What position value will fit our case best?
- The top and left values where given by the designer: top - 35px, left 275px.

```
img.banner{
    width: 1192px;
    position: absolute;
    left: 275px;
    top: -35px;
}
```

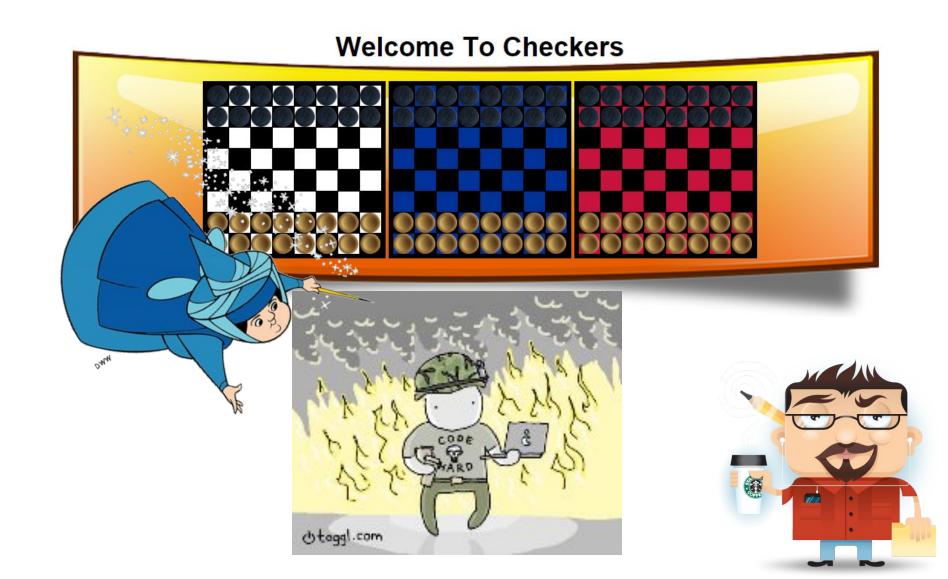

- This is what happened
- The button is positioned perfectly but it is hiding the boards

- We will use our last concept for today
- The z-index property specifies the stack order of an element.
- An element with greater stack order is always in front of an element with a lower stack order.
- Note: z-index only works on positioned elements like
- (position:absolute, position:relative, or position:fixed).

```
.boards-holder{
    text-align:center;
    z-index:2;
    position:relative;
img.banner{
    width: 1192px;
    position: absolute;
    left: 275px;
    top: -35px;
    z-index: 1;
```

#### <itc>

### **Questions?**

#### **Summary**

- You needed to understand:
  - Motivation why do we learn CSS?
  - How to work with CSS selectors (by tag, class or combined)
  - CSS precedence
- You need to remember:
  - Use the style tag and never write inline style again
- You need to practice:
  - Display property
  - CSS position

#### Questions

#### **Cheat Sheet**

```
css selectors
    Tagname {
      propname:propvalue;
class selector
    .dark{
      width: 30px;
❖ if the selectors are following (no space) they refer
 to the same element: td.light
descendants selector – noted by space
    table.white-table td.light{
      background-color: rgb(255,255,255);
      cursor: pointer;
      text-align: center;
```

Position	Relative to	Leaves gap (top, left)
Static	Normal position	Not affected
Fixed	View port	X
Relative	It's static position	V
Absolute	Nearest positioned ancestor	X

#### **Display property**

**Inline** (span, img, a)

- contain inline elements and content
- can't have width or height
- do not begin on a new line (attached to the preceding element)

#### Inline-block

like inline elements, but you can set their width and height

**Block** (div, h1, p)

- contain block elements, inline elements and content
- When no space limitation, can take up the entire screen
- begin on a new line and take all of that line

#### None

The document is rendered like the element doesn't exist
